

Vignesh Viswanathan was born and raised in Jamshedpur, Jharkhand till the age of 17. He pursued bachelors and Masters in Biotechnology in School of Life Sciences, Manipal. During his undergraduate studies, his interest in Biology grew tremendously and was awe struck by the complicated unknown behavior of what we call the simplest unit of life 'a cell'. He went on to pursue his PhD in cancer cell biology at University of Delaware, where he was introduced to the world of stem cells and its role in cancer. After Graduation, he moved to Boston for his first postdoctoral position at Harvard Medical School, and 2 years later to Stanford University where he works currently. Away from science, he enjoys playing outdoor sports, photography, trying new cuisines and dancing (when nobody is watching).
